High Pressure Air Treatment

RHP Series Refrigerated Dryers and E Series Filters for 700–900 psig Applications

The demand for clean, dry compressed air systems at 700–900 psig (49–63 bar) has never been greater. Industries like PET blow molding, injection molding, aeronautical valve and control testing require dry and filtered compressed air. A carefully engineered high pressure refrigerated dryer design provides a reliable method to remove moisture as a water vapor while coalescing filters remove solid particles, liquid water droplets, liquid oil and oil vapors from the compressed air system.

RHP Series Refrigerated Dryers offer Pressure Dew Points of 38° F (3° C)

Moisture (water vapor) is present in ambient air as a gas and cannot be filtered. A stainless steel plate heat exchanger designed for high pressure compressed air teams with a self-regulating, environmentally-friendly refrigeration system to ensure design dew point.

Series Coalescing Filters Remove Water Droplets and Solid Particles to 0.01 Micron

Water droplets are formed by the condensed water vapor present in ambient air. Solid particles come from ambient air contaminants like dust and from rusted, oxidized pipework. They can obstruct orifices used in laboratory testing procedures and cause pneumatic equipment to malfunction.

FHP Series Coalescing Filters Remove Oil and Oil Vapors to 0.0008 ppm (0.001 mg/m³)

Liquid oil and oil vapors are introduced by compressor coolants and by hydrocarbon vapors present in ambient air. Oil-free compressed air is particularly important in food and pharmaceutical processes where direct and indirect contact with compressed air occurs. Pharmaceutical testing and packaging is a common application for compressed air at 700–900 psig (39–63 bar) working pressure.

High Pressure Filtration

FHP Series Filters Offer 5 Grades of High Pressure Filtration

1. Grade B Separator/Filter removes bulk liquid and particles to 3 micron. Maximum inlet liquid load: 25,000 ppm w/w. Ideal as a particulate prefilter for RHP Series High Pressure Refrigerated Dryers.
2. Grade C General Purpose 1 micron particulate filter. Ideal as the first afterfilter after a high pressure refrigerated dryer.
3. Grade E High Efficiency Oil Removal Filter eliminates oil aerosols to 0.008 ppm (0.01 mg/m³). Maximum inlet liquid load: 1,000 ppm w/w.
4. Grade F Maximum Efficiency Oil Removal Filter eliminates oil aerosols to 0.0008 ppm (0.001 mg/m³). Maximum inlet liquid load 100 ppm w/w. This is the preferred “second afterfilter” for oil removal in high pressure systems.
5. Grade G Oil Vapor Removal Filter utilizes activated carbon to eliminate oil vapors to 0.003 ppm (0.004 mg/m³).

Instrumentation

- RHP Series models for 13–178 scfm feature: a power-on light which indicates when the dryer is energized and a high temperature warning light which gives immediate indication of malfunction or overload condition. A standard 6 foot power cord is included.
- RHP Series models for 50–178 scfm also feature: On/off switch and a refrigeration suction pressure gauge to indicate proper system operation.
- RHP Series models for 300–3750 scfm feature the following gauges: suction pressure gauge, inlet temperature gauge, outlet pressure gauge.
- RHP Series models for 300–3750 scfm feature the following lights: power-on, compressor-on, high evaporator temperature, refrigerant fault alarm. A high pressure reset switch is standard. An optional disconnect switch can also be supplied (pictured).

RHP Series

Integral FHP Series Filtration

- Integral FHP Series Grade B Separator/Filters are standard on all RHP Series models for air flows at 64 scfm and above. A two-stage process first removes the bulk liquid to 10 micron which has condensed in the heat exchangers using stainless steel orifice tubes. The second stage has in-depth coalescing fiber media which captures solid particulates to 3 micron and oil droplets to 5 ppm w/w (6 mg/m³).
- An automatic electric drain provides reliable condensate removal and the ability to program valve open time and time between cycles.

Grades C & E

Features

Compact Heat Exchangers

- Models for 13–100 scfm utilize smooth surface, self-cleaning copper heat exchangers.
- Models for 300–3750 scfm feature space-saving, smooth surface, stainless steel plate heat exchangers designed for high heat transfer efficiencies.

Environmentally Friendly Refrigeration System Design

- Environmentally friendly HFC refrigerants are utilized on all models: models for 13–1000 scfm utilize R-134a and models for 1250–3750 scfm feature R-404a designs.
- Tight refrigeration temperature control is achieved even during rapid load changes which is what allows the RHP Series to provide consistent dew points.

Table 7 – Inlet Pressure Correction Factors

To find the maximum flow at pressures other than the MOP, multiply 100 psi flow (@ 100 psig from table 1) by correction factor corresponding to minimum pressure at the inlet of the filter. Do not select filters by pipe size; use flow rate and operating pressure.

Minimum Inlet PSIG Pressure Bar	100 6.9	150 10.3	200 13.8	250 17.2	300 20.7	350 24.1	400 27.6	450 31	500 34.5	550 37.9	600 41.1	700 48.3	800 55.2	900 62.1
Correction Factor	1.00	1.44	1.87	2.31	2.74	3.18	3.62	4.05	4.49	4.92	5.36	6.23	7.10	7.97

* Models FHP28 and larger delivered with flange

Example: To size a filter for 1000 scfm at a pressure of 500 psi: 1. Choose approximate filter size, FHP16 (grade B,C,E,F,G). 2. Multiply the rated flow at 100 psi by the correction factor (250 scfm x 4.49 = 1,122 scfm) 3. Compare maximum calculated flow (1,122 scfm) to the required flow (1,000 scfm) 4. If the calculated flow is greater than the required flow, the filter can be used. If the calculated flow is less than the required flow, repeat the sizing process with a larger filter.
